 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB

                                                                                                                                                                                                                                                                                   CC This sequence corresponds to residues 170-206 of the human 25 kD CC synaptosomal associated protein (SNAP-25), and is a inhibitory agent of CC the invention. The agents of the invention inhibit secretion of CC neurotransmitter from neuronal cells and is an excitation-secretory CC uncoupling peptide (I) of at least 20 amino acids (aa) all of which CC correspond substantially to any one of AAW30097-W30102, or more CC generally any (I) that inhibits 50% of catecholamine secretion from CC bovine chromaffin cells at a concentration of 10 microM, especially 0.25 cmicroM, or less. (I) are used, as a replacement for Clostridium toxin, to CC inhibit release of neurotransmitters from synaptic vesicles, specifically CC for reducing muscle spasticity. Also (I) may be labelled to allow in CC unaging of intracellular distribution of (I). Compounds for CC delivering the drug to neural cells provide targeted drug delivery, e.g. CC of substance P to brain tumours for induction of apoptosis. Unlike the CC neurotoxins, (I) are not toxic or immunogenic and are more readily available. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required.
                                                                                                                                                                 Query Match

(I) are used, as a replacement for Clostridium toxin, to inhibit release of neurotransmitters from synaptic vesicles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of substance P to brain tumours for induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or induction of apoptosis. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required.
                                                                                      Homo sapiens
                                                                                                                                            synaptosomal associated
                                                                                                                                                                 Neurotransmitter secretion; inhibitor; neuronal cell; synaptic vesicle; excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction;
                                                                                                                                                                                                                                                                                     Neurotransmitter secretion
                                                                                                                                                                                                                                                                                                                                                 06-APR-1998

                                                                                                                                                                                                                                                                                                       This sequence corresponds to residues 181-206 of the human 25 kD synaptosomal associated protein (SNAP-25), and is a inhibitory agent the invention. The agents of the invention inhibit secretion of neurotransmitter from neuronal cells and is an excitation-secretory uncoupling peptide (I) of at least 20 amino acids (aa) all of which correspond substantially to any one of AAW30097-W30102, or more generally any (I) that inhibits 50% of catecholamine secretion from
                                                                                                                                 microm, or less. (I) are used, as a replacement for Clostridium toxin, to inhibit release of neurotransmitters from synaptic vesicles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of substance P to brain tumours for induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or immunogenic and are more readily available. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required.
                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Excitation-secretory uncoupling peptide(s) for inhibiting neuro:transmitter release - used particularly for treating spasticity, and for delivering drugs specifically to neurons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-MAR-1996;

                                                                                                                                    The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a human polypeptide C-terminal fragment, used in the scope of

                                                                                                                                                                                                                                                                                The invention relates to new peptides comprising 3-30 contiguous amino acids from the N-terminus of the protein SNAP-25 (synaptosomal-associated protein 25). The peptides AAB15581-B15586 represent examples of the peptides of the invention. The peptides have neuronal exceytosis inhibitory activity and are used for treatment of facial wrinkles and asymmetry and pathological neuronal exocytosis-mediated pathological disorders and alterations manifested e.g. by spasms and neurological and neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

toxin A has been shown to cleave the synaptosomal neurotransmitter peptide SNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022-Y44076) of the SNAP25 peptide (AAY44021, amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       type A botulinum toxin, by determining the proteolytic activity of botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin A has been shown to cleave the synaptosomal neurotransmitter peptide SNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022-Y44076) of the SNAP25 peptide (AAY44021, amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with a label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.
                                                                                                                                                   The invention relates to an enzymatic assay for the quantitation of type A botulinum toxin, by determining the proteolytic activity of botulinum neurotoxin type A using fluorescamine detection. Botulinum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Qγ
                                                                              The invention relates to an enzymatic assay for the quantitation of type A botulinum toxin, by determining the proteolytic activity of botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin A has been shown to cleave the synaptosomal neurotransmitter peptide sNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022 * 744076) of the SNAP25 peptide (AAY44021) amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with a label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin A has been shown to cleave the synaptosomal neurotransmitter peptide SNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022-Y44076) of the SNAP25 peptide (AAY44021, amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an enzymatic assay for the quantitation of type A botulinum toxin, by determining the proteolytic activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC type A botulinum toxin, by determining the proteolytic activity of cotulinum activity by determining the proteolytic activity of cotulinum neurotoxin type A using fluorescamine detection. Botulinum cc toxin A has been shown to cleave the synaptosomal neurotransmitter cc peptide SNAP25 between residues 197-198. The method comprises adding cc an analogue (e.g. ANY4002-Y4076) of the SNAP25 peptide (ANY4002). CC amino acids 187-203 of human SNAP25) to a sample containing the cc botulinum toxin A so that hydrolysis of the peptide is initiated, then cs topping hydrolysis of the peptide at different time points; and cmassuring the amount of hydrolysis at each time point by combining with a clabel capable of detecting free amino groups resulting from the chydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.

The method comprises adding an analogue (e.g. AAV44022-Y44076) of this peptide (which represents amino acids 187-203 of the human synaptosomal protein SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with a label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of

                                                                                                                                                                                       RESULT 6
                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an enzymatic assay for the quantitation of type A botulinum toxin, by determining the proteolytic activity of botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin A has been shown to cleave the synaptosomal neurotransmitter peptide sNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022-Y44076) of the SNAP25 peptide (AAY44021, amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with a label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.
                                                                                                                                                                                                                                                                                     Query Match

type A botulinum toxin, by determining the proteolytic activity of botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin A has been shown to cleave the synaptosomal neurotransmitter peptide SNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022-Y44076) of the SNAP25 peptide (AAY44021, amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, the stopping hydrolysis of the peptide at different time containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin A has been shown to cleave the synaptosomal neurotransmitter peptide SNAP25 between residues 197-198. The method comprises adding an analogue (e.g. AAY44022-Y44076) of the SNAP25 peptide (AAY44021, amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY44058;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Вb
                       type A botulinum toxin, by determining the proteolytic activity of to botulinum neurotoxin type A using fluorescamine detection. Botulinum toxin, by determining the proteolytic activity of toxin A has been shown to cleave the synaptosomal neurotransmitter peptide SNAP25 between residues 197-198. The method comprises adding amino acids 187-203 of human SNAP25) to a sample containing the botulinum toxin A so that hydrolysis of the peptide is initiated, then stopping hydrolysis of the peptide at different time points; and measuring the amount of hydrolysis at each time point by combining with a label capable of detecting free amino groups resulting from the hydrolysis. The amount of botulinum toxin A present in the sample is determined by comparing measurements with the amount of label produced from a known concentration of toxin measured under similar conditions. The method is useful for the quantitation of type A botulinum toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                               Q
                                                                                                                                    method of treating a patient suffering from poisoning or at risk of CC method of treating a patient suffering from poisoning or at risk of CC (N-ethylmaleimide-sensitive fusion protein)-attachment protein receptor) CC to a cell of the patient, where the SNARE is resistant to proteolysis by CC the toxin (toxin-resistant SNARE) and/or is capable of inhibiting the CC toxin (toxin-inhibitory SNARE). The protein can be used in a method of CC treating a patient in need of inhibition of SNARE-dependent exocytosis comprises CC supplying a fragment, variant, fusion or derivative of a SNARE or a recombinant polynuclectide encoding the SNARE or an inhibitory SNARE or a recombinant polynuclectide encoding the SNARE is CC supplying a fragment of a medicament for the treatment of a patient CC suffering from poisoning or at risk of poisoning by clostridial toxin, CC e.g. from botulism or tetanus. The fragment, variant, fusion or CC derivative of a SNARE or of an inhibitory SNARE, or a recombinant could be considered by constitution of SNARE or of an inhibitory SNARE, or a recombinant CC polynuclectide encoding either of these SNARE polypeptides are useful in the manufacture of medicament for the treatment of a patient in need of inhibition of SNARE-dependent exocytosis from a cell capable of performing SNARE-dependent exocytosis from a cell capable of taking the paritent out of critical state.
                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                     The sequence represents the amino acid sequence of synaptosomal-associated protein, SNAP25, mutant Q197K/R198H, used in a new method of treating a patient suffering from poisoning or at risk of poisoning by a clostridial toxin, comprising supplying a SNARE (soluble (N-ethylmaleimide-sensitive fusion protein)-attachment protein receptor) to a cell of the patient, where the SNARE is resistant to proteolysis by the toxin (toxin-resistant SNARE) and/or is capable of inhibiting the toxin (toxin-inhibitory SNARE). The protein can be used in a method of treating a patient in need of inhibition of SNARE-dependent exocytosis from a cell capable of performing SNARE-dependent exocytosis comprises supplying a fragment, variant, fusion or derivative of a SNARE or an inhibitory SNARE to the cell of the patient. The toxin resistant or toxin inhibitory SNARE or a recombinant polynucleotide encoding the SNARE is useful in the manufacture of a medicament for the treatment of a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating a patient suffering from poisoning or at risk of poisoning a clostridial toxin, e.g. botulism, comprises administering a toxin-resistant or toxin-inhibitory SNARE -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     toxin-inhibitory SNARE; botulism; tetanus; SNARE-depend synaptosomal-associated protein; mouse; mutant; mutein; N-ethylmaleimide-sensitive fusion protein;

The fragment variant, fusion or derivative of a SNARE or of an inhibitory SNARE, or a recombinant polynucleotide encoding either of these SNARE polypeptides are useful the manufacture of medicament for the treatment of a patient in need inhibition of SNARE-dependent exocytosis from a cell capable of performing SNARE-dependent exocytosis. The method of treatment is relatively fast, thus alleviating the symptoms when most severe and taking the patient out of critical state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         toxin-inhibitory SNARE; botulism; tetanus; SNAR synaptosomal-associated protein; mouse; mutant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC method of treating a patient suffering from poisoning or at risk of CC poisoning by a clostridial toxin, comprising supplying a SNARE (soluble CC (N-ethylmaleimide-sensitive fusion protein)-attachment protein receptor) CC to a cell of the patient, where the SNARE is resistant to proteolysis by the toxin (toxin-resistant SNARE) and/or is capable of inhibiting the CC toxin (toxin-inhibitory SNARE). The protein can be used in a method of treating a patient in need of inhibition of SNARE-dependent exocytosis comprises CC from a cell capable of performing SNARE-dependent exocytosis comprises CC supplying a fragment, variant, fusion or derivative of a SNARE or an CC inhibitory SNARE to the cell of the patient. The toxin resistant or toxin inhibitory SNARE or a recombinant polynucleotide encoding the SNARE is useful in the manufacture of a medicament for the treatment of a patient CC suffering from poisoning or at risk of poisoning by clostridial toxin, CC e.g. from botulism or tetanus. The fragment, variant, fusion or derivative of a SNARE or of an inhibitory SNARE, or a recombinant CC entrynucleotide encoding the SNARE of the manufacture of medicament for the treatment of a patient CC polynucleotide encoding either of these SNARE polypeptides are useful in CC entry of SNARE-dependent exocytosis from a cell capable of creatment is satient out of critical state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

AA;

taking

The present

the patient out of critical state. The present sequence is not shown in from the mouse SNAP-25 sequence g

in the sp given in

specification but in figure 8 (see A/

(see AAU00246).

```
useful in the manufacture of a medicament for the treatment of a patie suffering from poisoning or at risk of poisoning by clostridial toxin, e.g. from botulism or tetanus. The fragment, variant, fusion or derivative of a SNARE or of an inhibitory SNARE, or a recombinant polynucleotide encoding either of these SNARE polypeptides are useful the manufacture of medicament for the treatment of a patient in need of inhibition of SNARE-dependent exceytosis from a cell capable of performing SNARE-dependent exceytosis. The method of treatment is relatively fast, thus alleviating the symptoms when most severe and taking the patient out of control states.
                                                                                                                                                                                                                                                                                                                                              method of treating a patient suffering from poisoning or at risk of poisoning by a clostridial toxin, comprising supplying a SNARE (soluble (N-ethylmalelmide-sensitive fusion protein)-attachment protein receptor) to a cell of the patient, where the SNARE is resistant to proteolysis by the toxin (toxin-resistant SNARE). The protein can be used in a method of toxin (toxin-inhibitory SNARE). The protein can be used in a method of treating a patient in need of inhibition SNARE-dependent exocytosis
                                                                                                                                                                                                                                                                     from a cell capable of performing SNARE-dependent exocytosis, comprises supplying a fragment, variant, fusion or derivative of a SNARE or an inhibitory SNARE to the cell of the patient. The toxin resistant or tox inhibitory SNARE or a recombinant polynucleotide encoding the SNARE is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating a patient suffering from poisoning or at risk of poisoning by a clostridial toxin, e.g. botulism, comprises administering a toxin-resistant or toxin-inhibitory SNARE -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNAP-25; poisoning; clostridial toxin; SNARE; toxin-resistant SNARE; toxin-inhibitory SNARE; botulism; tetanus; SNARE-dependent exocytosis; synaptosomal-associated protein; mouse; mutant; mutein; N-ethylmaleimide-sensitive fusion protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         associated protein, SNAP25, mutant Q197A/R198K, used in a new
